This report contains a wide range of useful information about the operations and performance of the Organ Procurement Organization (OPO). The report is divided into seven main sections:

A. Description of the Donation Service Area (DSA) Served by GALL  
B. US Population Density, Deaths, Death Rates, and Donations  
C. Organ Utilization  
D. Description of Donors Recovered by GALL  
E. Programs Transplanting Organs Procured by GALL  
F. Transplants Facilitated by GALL  
G. Counties Served by GALL  

Some common abbreviations are used throughout the report:

Organ Designators:
HR: Heart  
IN: Intestine  
KI: Kidney  
LI: Liver  
LU: Lung  
PA: Pancreas

Other Abbreviations:
DSA: Donation Service Area  
DBD: Donation after Brain Death  
DCD: Donation after Circulatory Death

Section A: Description of the Donation Service Area Served by GALL

Section A provides a broad geographic overview of the area of the United States served by the OPO. Figure A1 shows the DSA within the context of the nation with the location of the OPO’s headquarters indicated on the map. Figure A2 zooms in on the OPO’s DSA and highlights counties served by the OPO. SRTR staff worked with each OPO during 2013 to determine the list of counties functionally served by the OPO. This list may not necessarily match the list of official CMS-designated counties for each OPO. For a full description of the counties served, see Section G. Figure A2 also shows the locations of transplant programs within the DSA. All transplant programs within the DSA are identified in Table A1. Note that only programs that performed at least one transplant of the various types from 07/01/2018 to 06/30/2019 are listed in Table A1.
Section B: US Population Density, Deaths, Death Rates, and Donations

Section B describes the population of the US served by the OPO. Figure B1 provides a map of the population density of the US with the DSA highlighted. Summary statistics are provided for the OPO along with an indication of where the OPO ranks among the 58 OPOs. Figures B2 and B3 are similar, but provide different perspectives, with Figure B2 focusing on deaths per 1000 population and Figure B3 focusing on deaths per 1000 square miles covered by the OPO. Note that each of these maps, population data are derived from the US Census Bureau. For a more detailed description of the counties served by this OPO, see section G.

Table B1 provides counts of deaths meeting the eligible death definition (as reported by each donor hospital) along with counts of donors procured by the OPO (total donors and those meeting the eligible death definition). To contextualize these numbers, minimum, maximum, and average values for all 58 OPOs are provided. The observed donation rate per 100 eligible deaths and the expected donation rate per 100 eligible deaths are provided. The expected donation rate is determined from a statistical model and is described in the OSR Technical Methods document. The standardized donation rate ratio is the observed donation rate divided by the expected donation rate. The $P$ Value indicates if the standardized donation rate ratio is statistically significantly different from 1.0. If the $P$ Value is less than 0.05, we have evidence that the standardized ratio is either higher or lower than expected and that this difference is likely not due to chance alone. Additionally, the 95% confidence interval (CI) of the standardized donation rate ratio will not include 1.0 if the $P$ Value is less than 0.05. The standardized donation rate ratio is put in context of all 58 OPOs in Figure B4. Figure B4 is arranged by the number of eligible deaths within each DSA so that you can more easily compare the OPO with OPOs of similar size. Finally, trends in donations per 100 eligible deaths over the five most recent one-year periods are shown in Figure B5.

Table B2 provides counts of eligible deaths and actual donors procured from each of the donor hospitals served by the OPO. “Additional Donors” are those donors that did not meet the eligible death definition. Observed and expected donation rates per 100 eligible death are provided for each donor hospital, but tests of whether each hospitals donation rate is significantly higher or lower than expected are not performed due to generally small sample sizes within each donor hospital.

Section C: Organ Utilization

Section C begins by providing 5-year trends in the numbers of organs transplanted by organ type and donor type (donations after brain death [DBD] and donations after circulatory death [DCD]). Figure C1, Figure C2, and Figure C3 present counts of transplants in total (Figure C1), for DBD donors (Figure C2), and for DCD donors (Figure C3). For the purpose of counting transplants, right and left kidneys are counted separately, as are right and left lungs. The “Donors” count simply counts the donors from whom at least one organ was recovered for the purpose of transplant. Table C1 then provides a full description of the numbers of donors authorized by each organ type along with the
The ultimate disposition of the organs for the most recent one-year period. In Table C1, kidneys and lungs are counted individually yielding approximately twice the number of organs authorized when compared to the other organs. Table C2 presents organ-specific donation rates per 100 eligible deaths. Expected rates are based on a statistical model detailed in the OSR Technical Methods document. If the P Value is less than 0.05, we have evidence that the difference between the observed and expected organ-specific donation rate is not simply due to chance. Figure C4 presents the standardized organ-specific donation rate ratios along with their 95% confidence intervals (CI).

Figures C5 and C6 present organs recovered per donor and organs transplanted per donor, respectively. Each of these figures presents where the OPO stands relative to all 58 OPOs with the OPO’s performance indicated by the diamond. The distribution of all 58 OPOs is shown by the bell-shaped curve with the national average of all 58 OPOs indicated by the horizontal line. Trends in organs transplanted per donor over the previous five 1-year periods are shown in Figure C7.

Table C3 presents the Observed vs. Expected organ yields for the most recent 2-year period. For a full description of the models used by the SRTR to estimate expected organ yields, please visit our website at www.srtr.org. The Observed to Expected (O/E) organ-specific ratios are then presented graphically in Figure C8 so that it can be seen where the OPO stands relative to the other OPOs. In Figure C8, the x-axis is the number of donors procured by each OPO so that one can compare the OPO with other OPOs that are relatively the same size.

Figures C9, C10, and C11 present data specific to donors after brain death (DBD) and donors after circulatory death (DCD). Figure C9 shows 5-year trends in the number of organs transplanted per donor by DBD and DCD status with comparisons to the US as a whole. Figures C10 and C11 present where the OPO stands in relation to all 58 OPOs with regards to organs transplanted per DBD/DCD donor.

Section D: Description of Donors Recovered by GALL

Section D presents tabular descriptions of the donor recovered by the OPO. Data are shown for the most recent two years with comparisons to the US as a whole. Breakdowns are provided for race, age, gender, blood type, cause of death, and DCD status.

Section E: Programs Transplanting Organs Procured by GALL

Section E presents “flight maps” showing locations of programs that transplanted organs from the OPO. Separate maps are provided for each organ type. Note that all arrows originate from the location of the OPO’s headquarters rather than the location of each donor hospital. In addition, many programs within the OPO’s DSA will not be visible on the map due to scale. Each map is accompanied by a table providing the full detail of each program transplanting organs recovered by the OPO. Geographic indicators are provided based on whether the program is within the same DSA (Local), within the
the same OPTN region but not the same DSA (Regional), or not within the same DSA or OPTN region (National).

Section F: Transplants Facilitated by GALL

Section F provides tabular descriptions of the recipients that received organs that were procured by the OPO, regardless of where the transplant took place. Separate tables are provided by each organ type along with separate tables for heart-lung recipients and kidney-pancreas recipients. The most recent two years are provided along with data for the US as a whole for the same two periods. Breakdowns are provided by demographic factors (race, age, and gender) and clinical factors (blood type, PRA [kidney, pancreas, and kidney-pancreas only], medical urgency status [if applicable], Expanded Criteria Donor status [kidney only], and primary cause of disease).

Section G: Counties Served by GALL

Table G1 presents the counties served by the OPO. Counties are ordered alphabetically within state. For the purposes of this report, counties are those actually served by the OPO and do not necessarily reflect CMS assignments. SRTR staff worked closely with the OPOs during 2013 to determine the correct county assignments. Please contact the SRTR at srtr@srtr.org if you feel any counties are assigned in error. If more than one OPO serves different donor hospitals within the same county, the county is indicated as a shared county and the OPO sharing the county is indicated by OPO code. For the purpose of calculating population density, land area, and death rates presented in Section B, the one-to-one CMS county to OPO assignment is used.

*Performed at least one transplant of that type from 07/01/2018 to 06/30/2019.

(See Tables A1 and G1 for more details)
B. US Population Density, Deaths, Death Rates, and Donations

Figure B1. Population density*

Population of GALL's DSA: 10,619,608. This ranks 8th among the 58 DSAs (1st is the highest).

Land area of GALL's DSA: 58,216 square miles. This ranks 16th among the 58 DSAs (1st is the highest).

*US Census Bureau, 2018 projected population/2010 land area

Figure B2. Deaths per 1000 population*

Deaths within GALL's DSA: 85,950. This ranks 8th among the 58 DSAs (1st is the highest).

Death rate within GALL's DSA: 8.09. This ranks 45th among the 58 DSAs (1st is the highest).

*US Census Bureau, 2018 projected death (includes all deaths, not limited to eligible deaths) and population

Figure B3. Deaths per 1000 square miles*

Deaths per 1000 square miles within GALL's DSA: 1,476. This ranks 31st among the 58 DSAs (1st is the highest).

*US Census Bureau, 2018 projected death (includes all deaths, not limited to eligible deaths) and population

The data reported here were prepared by the Scientific Registry of Transplant Recipients (SRTR) under contract with the Health Resources and Services Administration (HRSA).
