Stanford Lung and Heart/Lung Transplant Program

Re: SRTR January 2024 Lung Transplant Program Specific Report 3-year survival outcomes

This report does not show the correct 3-year outcomes of lung transplant recipients at Stanford Health Care. The true 3-year survival for this group is greater than 70%.

SRTR changed how they calculate 3-year survival. This is for transplants done during the COVID-19 pandemic. But the new statistical method does not show our true outcomes. We shared our concerns with SRTR and asked they address the inaccurate information.

Please feel free to contact us if have any question or concerns.
