Re: Comments for SRTR 01/24 PSR Kidney 3-yr Graft Survival Rate

In SRTR 01/24 published reports, our center Kidney 3-yr graft survival rate is 81.56% which is extremely lower than our kidney history level. The reason is that the COVID carve-out coming into the 3-year cohort has created a very small set of patients that have a full 3-year follow-up, so a few graft failures can impact the Kaplan-Meier estimate. With the information that non-COVID carve-out reports that SRTR provided, our kidney 3-yr graft survival rate is 88.89% which are match our historical data.
