SRTR Liver Outcomes Comment:

The Current SRTR release for our Liver Program in January 2024 shows a slight decline in 90 day liver transplant patient and graft survivals. In evaluating the decline in our 90 day liver transplant patient and graft survival, we performed an in depth review of our program. We identified a number of key causes to the increased rate and introduced a number of changes to program operations to enhance patient and graft survival post-transplant. We have increased the frequency of pre-transplant cardiac evaluations to annual for all our patients and made leadership changes at the program and organ director levels. This change, in concert with other policy changes, have improved organ/patient matching to ultimately enhance patient and graft survival.

Please contact our Center for any questions you may have.

Thank you,

Tracy Drufovka, MSW
Regional Director, Transplant Services
